

**CSS**

```
body {  
  font: x-small  
  background: #  
  color: black;  
  margin: 0;  
  padding: 0;
```

# Outline

1. CSS Syntax
2. CSS Selectors
3. Basic Text Styles
4. Margin, Border and Padding

# CSS Syntax

↓ Selector

```
.my-css-rule {  
  background: red;  
  color: beige;  
  font-size: 1.2rem;  
}
```

Declaration →

Property Value

The diagram illustrates the components of a CSS rule. The selector '.my-css-rule {' is highlighted in a light blue box, with a blue arrow labeled 'Selector' pointing to it. The declaration 'color: beige;' is highlighted in a light green box, with a blue arrow labeled 'Declaration' pointing to it. Within this declaration, 'color:' is in a light red box and 'beige;' is in a light blue box. The property 'color:' is labeled 'Property' with a blue arrow, and the value 'beige;' is labeled 'Value' with a blue arrow. The other declarations 'background: red;' and 'font-size: 1.2rem;' are not highlighted. The closing brace '}' is also present.

# CSS – Cascading Style Sheets

- CSS is used to control the **presentation** (*look and feel*) and **layout** (*positioning*) of web page elements
- Allows **separating** web page content from its design and **visual appearance**
- Used in conjunction with HTML
  - **HTML** is used for describing the **content** of a web page, **CSS** is used for describing its **presentation**
- CSS a flexible, cross-platform, **standards-based** styling language developed by the **W3C**

# Style Sheets Syntax

- Stylesheets consist of **rules** that describe the styling to be applied
  - Each rule has **selectors** and **declarations**. A declaration specifies a **property** and its **value**

- Declarations are separated by semicolons
- Properties and values are separated by colons
- Comment in CSS `/* comment */`

# Ways to incorporate CSS in an HTML document

- **Inline** – style included as the attribute of an HTML tag:

```
<p style="color:sienna;margin-left:20px;">This is a paragraph.</p>
```

- **Embedded** – CSS rules are contained in the head section:

```
<head>
<style>
p {color:sienna; margin-left:20px;}
body {text-align:center;}
</style>
</head>
```

- **External** - separate .css file referenced in the HTML:

HTML source code:

```
<head>
<link rel="stylesheet" href="main.css">
</head>
```

'main.css':

```
p {color:sienna;
margin-left:20px;}
body {text-align:center;}
```

- ✓ Ensure
- ✓ Improve **consistent look and feel**, **reusability** and **maintainability**

# The “Cascade”

- The **last rule applied wins**: Styles are applied in the order that they're found, and last styles always overwrite earlier styles in case of a conflict

```
<link rel="stylesheet" href="styles/qu-styles.css">  
<link rel="stylesheet" href="styles/ceng-styles.css">  
<link rel="stylesheet" href="styles/cse-styles.css">
```

cse styles will win in case of a conflict

inline styles will win in case of a conflict

The diagram shows a file icon labeled 'index.htm' with an orange 'HTML' label. An arrow points from this icon to a paragraph of text: `<p style="font-size: .9em; margin-bottom: 1.2em;">`.

index.htm

# Inheritance

- Inheritance means that child elements will **inherit** the properties applied to a parent element

main.css

```
body {font-family: Arial;  
      font-size: 100%;  
      color: gray;}  
  
h1 {color: #900}
```

index.htm

```
<html>  
  <head>...</head>  
  <body>  
    <h1>Main heading</h1>  
    <p>This is body copy.</p>  
    <h2>This is a subheading</h2>  
    <p>More body copy</p>  
  </body>  
</html>
```

## Main heading

This is body copy.

### This is a subheading

More body copy

- Body selector has a font, font-size, and color applied to it:
  - Every element **inherits** those styles from the body selector
  - The style applied to h1 **overrides** the inherited color => h1 element appears in red berry color

# CSS Selectors

# Selectors: used to select elements to style on an HTML page

- **Element Selectors** - matches a HTML element directly

- Apply page-wide

- e.g., **p { font-family: verdana; }** applies the style to all `<p>` tags

- **Class Selectors**

- Defines a **named** style (prefix the name with dot (.) )

- Can apply to any page element using the class attribute

- e.g., **.redBorder {border: 1px solid red}** defines a style named redBorder

- <p class='redBorder'>Using the class attribute to apply the redBoder style to this paragrph</p>**

- **ID Selectors**

- Apply to one specific tag

- Use hash (#) followed by the tag id to select the element to be styled

- Good for linking to specific part of a page

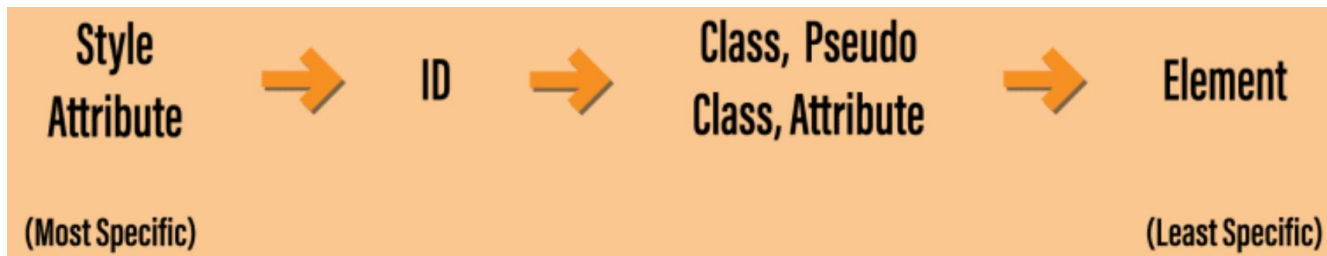

- e.g., **#errorMsg { color: red; }** apply the style to the element with id **errorMsg**

# Specificity

```
<h1 id="my-heading" class="red">What colour am I?</h1>
```

```
.red {  
  color: red;  
}  
  
#my-heading {  
  color: blue;  
}  
  
h1 {  
  color: green;  
}
```

- We have 3 selectors for the h1 with different colors
  - What will the color be?  
=> h1 would be **blue**  
because the ID selector is more specific than the others
- The style for a **more specific selector** will be **applied** to the element

# Universal

- [\*]: Selects all elements
  - Used to override the browser default styles

```
* {  
    font-family: "Times New Roman";  
    color: blue;  
}
```

# An element can have more than one class

```
<h1 class="red bold">Red and Bold</h1>
<h1 class="blue bold">Blue and Bold</h1>
<h1 class="bold">Bold</h1>
<h1 class="blue">Blue</h1>
```

```
.red {
  color: red;
}

.blue {
  color: blue;
}

.bold {
  font-weight: bold;
}
```

- Class Selector selects all elements whose **class attribute** matches the selector
  - The selector starts with a period (.) followed by the class name
  - An element can have more than one class

# Combined Selectors

element, element	div, p	Selects all <div> elements and all <p> elements
element element	div p	Selects all <p> descendant elements inside <div> elements
element > element	div > p	Selects all <p> elements that are <b>direct child</b> of <div> element

e.g.,

**li a** {text-decoration: none}

- This will match all <a> tags that are inside of <li>

[https://www.w3schools.com/cssref/css\\_selectors.asp](https://www.w3schools.com/cssref/css_selectors.asp)

# Attribute Selectors

- Selects the elements whose attribute-value pair matches the selector

[attribute <b>^</b> = value]	a[href <b>^</b> = "https"]	Selects every <a> element whose href attribute value begins with "https"
[attribute <b>\$</b> = value]	a[href <b>\$</b> = ".pdf"]	Selects every <a> element whose href attribute value ends with ".pdf"
[attribute <b>*</b> = value]	a[href <b>*</b> = "qu"]	Selects every <a> element whose href attribute value contains "qu"

[https://www.w3schools.com/cssref/css\\_selectors.asp](https://www.w3schools.com/cssref/css_selectors.asp)

# Pseudo-classes

- **Pseudo-classes** are used to define an **element state**. E.g.,
  - Style an element when a mouse is over it (`:hover`)
  - Style visited and unvisited links differently (`:visited` , `:link`)
  - Style an element when it gets focus (`:focus`)

e.g.,

`a:hover { color: red; }` -> Style link on mouse over

```
/* unvisited link */
a:link {
  color:  firebrick;
}

/* visited link */
a:visited {
  color:  limegreen;
}
```

```
input:focus {
  background-color:  yellow;
}
```

# Structural Pseudo-classes

:first-child	<b>tr:first-child</b>	First row of an HTML table
:last-child	<b>tr:last-child</b>	Last row of an HTML table
:nth-child( <i>n</i> )	<b>tr:nth-child(2)</b>	Second row of an HTML table
:nth-last-child( <i>n</i> )	<b>tr:nth-last-child(2)</b>	Second row of an HTML table, counting from the last row
:nth-child(odd)	<b>tr:nth-child(odd)</b>	Every odd row of an HTML table
:nth-child(even)	<b>tr:nth-child(even)</b>	Every even row of an HTML table

<https://www.w3schools.com/cssref/trysel.asp>

# has selector

- CSS **:has()** selector allows us to style an element based on its descendants
- e.g., assign a green background to any div having p as its descendent

```
div:has(p) {  
  background-color:  limegreen;  
}
```

# Pseudo-elements

- A CSS pseudo-element is used to style specified parts of an element. E.g.,
  - Style the first letter or line of an element

```
p::first-letter { color:  #ff0000; }  
p::first-line { color:  #0000ff; }
```

- **Insert content** around the selected element

```
p::before { content: "«"; }
```

Insert « before the content of each <p> element

```
p::after { content: "»"; }
```

Insert » after the content of each <p> element

# Selectors Summary

- A style consists of a selector, followed by property/value pairs
- Selectors:
  - Element Selectors
  - Class Selectors
  - ID Selectors
  - Combined Selectors
  - Attribute selectors
  - Pseudo-classes
  - Structural pseudo-classes
  - Pseudo-elements

## Examples

- ▼ 2.selectors
  - 1.Attribute Selectors.html
  - 2.Structural Selectors (empty).html
  - 3.Structural Selectors (first-of-type).html
  - 4.Structural Selectors (nth-child).html
  - 5.Pseudo-classes.html

# Basic Text Styles

# Text-related CSS Properties

- **color** – specifies the color of the text
- **font-size** – size of font: `xx-small`, `x-small`, `small`, `medium`, `large`, `x-large`, `xx-large`... or numeric value
- **font-family** – comma separated font names
  - Example: `verdana`, `sans-serif`, ...
  - The browser loads the first one that is available
- **font-weight** can be `normal`, `bold`....

# Text-related CSS Properties (2)

- **font-style** – styles the font
  - Values: **normal**, **italic**, **oblique**
- **text-decoration** – decorates the text
  - Values: **none**, **underline**, **line-through**...
- **text-align** – defines the alignment
  - Values: **left**, **right**, **center**, **justify**

# Font Sizing

Two ways to define font sizes in CSS

- **Fixed Font Sizing**: defines the size of fonts using absolute units such as points (**pt**) or pixels (**px**)
- **Relative Font Sizing**: defines the size of fonts using relative units such as **em** and **rem** units
  - This allows fonts to scale appropriately to different resolutions, browsers or platforms
  - **em** is relative to the font-size of its direct or nearest parent
  - **rem** is relative to the font-size of the html (root) element

# Relative Font Sizing

```
body {font-size: .8em;  
      font-family: Verdana, Helvetica, Sans-Serif;}  
h1    {font-size: 1.2em;}  
div   {font-size: .8em;}  
li     {font-size: .8em;}  
p      {font-size: .8em;}
```

## 03.text-styles

 1.font-size.html

 2.em-vs-rem.html

# Styles for Lists

- List properties are used to define the look and feel of the list items
  - Values for `<ul>`: `circle`, `square`,...
  - Values for `<ol>`: `upper-roman`, `lower-alpha`
  - Values for both: `none`

```
ul  
{  
    list-style-type:none;  
}
```

# Practice ...

- Use the W3Schools try-it-yourself editor to try styling each of these properties
- **Background**  
[http://www.w3schools.com/css/css\\_background.asp](http://www.w3schools.com/css/css_background.asp)
- **Text**  
[http://www.w3schools.com/css/css\\_text.asp](http://www.w3schools.com/css/css_text.asp)
- **Fonts**  
[http://www.w3schools.com/css/css\\_font.asp](http://www.w3schools.com/css/css_font.asp)
- **Lists**  
[https://www.w3schools.com/css/css\\_list.asp](https://www.w3schools.com/css/css_list.asp)

# Margin, Border and Padding

# Box Model

- Each tag is a box, and its properties can be styled:
  - **Margin** - the space that separates the boxes
  - **Border** - the line around each edge of the box
  - **Padding** - the space between the border and the contents

# Margin and Padding

- Margin and padding define the spacing around the element
  - Numerical value, e.g. **0.8rem**
  - Can be defined for each of the four sides separately: **margin-top**, **padding-left**, ... or using short rules:
- **margin: 0.8rem;**
  - Sets all four sides to have margin of **0.8rem**
- **margin: 10px 20px;**
  - top and bottom to 10px, left and right to 20px
- **margin: 1px 3px 5px 7px;**
  - top, right, bottom, left (clockwise from top)
- Same for padding

# Borders

- Border style:

`border-width: 1px;`

`border-style: solid;`

`border-color: red;`

- **border-width:** `thin`, `medium`, `thick` or numerical value
- **border-color:** `color alias` or `RGB value`
- **border-style:** `none`, `dotted`, `dashed`, `solid`, `double`, ...

- Shorthand rule for setting border properties:

`border: 1px solid red;`

- Can specify different borders for the sides using:  
`border-top`, `border-left`, `border-right`, `border-bottom`

# Rounded Corner & Centered Box

جامعة قطر  
QATAR UNIVERSITY

Qatar University is a leading institution of academic and research excellence in the region

```
.centered-rounded-box {  
  display: flex;  
  column-gap: 1rem;  
  align-items: center;  
  
  padding: 0.5rem;  
  border: 1px solid saddlebrown;  
  border-radius: 15px;  
  
  width: 80%;  
  margin: auto;  
}
```

Rounded Corner  
box

Centered box
